

We can remediate a very wide range of organic pollutants in both solid wastes and waste waters. Also, we can eliminate detectable odors, usually within minutes. Pests that procreate by larvae, like flies and fire ants, can be wiped out in one generation.

In agriculture, we can increase crop yields at least 100% on a sustainable basis, results that can be reproduced in any soil type, anywhere. And, we can restore exhausted and compacted farm lands to a prime state, often better than it ever was.

In renewable energy, we can increase bio fuel yields very substantially, creating a very profitable and continuing new business model for this emerging field.

Of course, all our products are completely safe and our biotech has been approved for use and manufacture in the U.S. by the E.P.A.
